

How come you still don't have a BI solution?

Business Process Audit is a universal solution for process analysis monitoring. It is based on retrieving and evaluating information from individual components which are set in the complex environment of the SOA architecture. The key functionality includes an immediate status evaluation of all followed processes on one screen. It also enables the evaluation and process analysis of a longer time span, as well as detailed information retrieving for individual processes.

PRODUCTS AND
IT SOLUTION

BP Audit is a finalist in the
2012 IT PRODUCT contest

BP Audit is a suitable instrument for organizations with an extensive information system. It provides managers and IT administrators with a tool to track the activity and capacity of individual components in the information system. Besides that, it can identify the causes of application mistakes. It also features planning and running the operation of individual components, behaviour analysis of the information system and its users, as well as individual cases (such as tracking the process status) - all that in real-time.
